Feedback

tc4

- Case is unclear
- “Assigning employee to a working shift without selecting”, what are we not supposed to select for the test case?

tc6:

- possible error handling
- If a department is chosen and nothing else then the remove from schedule button does nothing

tc8:

- Role isn't mentioned in the test data and is also not required but TC 9 mentions not supplying all fields and that it is meant to show an error.

tc10:

- It is possible to fill in anything in the role combo box and no errors are shown.

tc12:

- Employees are automatically selected on load so deleting without selecting was not tested and apologies for accidentally deleting employees, we only realised afterwards the first entry was automatically selected.

tc13:

- You have to remove all the shifts for that day entirely and re-add it to edit the shift which is extra work for the user.

tc14:

- there are only three checkboxes to choose, it unclear what its meant with invalid input, and tc15 already has a description when nothing is selected

tc15:

- removed employee and when not selecting a new shift it gives evening as standard

tc17:

- when editing employee info if not selecting the department the app will not respond.
- After some time it will just put the person with no department

tc18:

- what is the difference between this tc and tc17, it is very unclear

tc19

- when restocking it goes to the warehouse amount and then refreshing, the in store amount is overwritten by the warehouse amount.

tc20

- datagrid is always auto-selecting, therefore, it can't be done to carry the test without selecting

tc22:

- The application does give an employee permission to restock and the data changes in the database.

tc24

- The application adds the department with the numbers and shows no error

Other bugs/ possibly unintended features we noticed:

- Uc6: the button view schedule disappears when clicked and it is impossible to refresh your schedule without restarting the application
- Not all of their Use case is are in the test case (e.g. UC 5 & UC 7)
- Sometimes is not exactly clear what to do in the test cases (Test case name ends with “without selecting..” leading to us not knowing what we shouldn’t select, Test case data not matching with what the name of the test case implies we should do)
- register button on the form shows a menu resetting the password

Recommendations:

- Sign out button
- Make the forms the same size so when switching it doesn't make the app smaller or larger each time
- A way to load or use the stock overview tab on the home page since we couldn't figure out what it was used for or how to use it.
- On the employee overview it would be easier to show the employee names per day instead of an amount.
